

Sales Call Analytics & Workforce Optimization Dashboard

Business Problem:

The organization lacked actionable call-center performance data needed to align staffing with customer demand. Leadership had limited visibility into call volume, average call duration, representative activity, and missed opportunities, creating challenges in determining whether staffing levels were appropriate during peak demand periods.

Business Objective:

Analyze call activity to understand demand patterns, representative workload, and missed opportunities, enabling leadership to make data-driven staffing decisions.

Outcome:

Developed a sales call analytics dashboard that provided leadership with visibility into call demand, representative workload, call duration, and missed opportunities, enabling data-driven evaluation of staffing requirements and identification of potential revenue opportunities.
