

EMPLOYEE PRODUCTIVITY DASHBOARD

Business Problem

The existing employee productivity report contained 20 pages of reporting information and required a more efficient approach to data organization, report consumption, and refresh operations.

The business needed a streamlined reporting solution that could:

- Reduce report complexity and improve usability.
- Consolidate existing data into a more efficient data model.
- Support more efficient data refresh operations.
- Enable location-level analysis and enterprise-wide reporting.
- Allow users to filter and explore productivity information based on their reporting needs.

Solution

I developed a 4-page Power BI dashboard that consolidated the existing reporting information into a streamlined data model and interactive reporting experience.

Key Improvements

Report Optimization: Reduced the report from 20 pages to 4 pages.

Data Modeling: Built a consolidated data model to support reporting and analysis.

Incremental Refresh: Implemented incremental refresh to improve data refresh efficiency.

Interactive Reporting: Developed slicers and filters for location-level analysis.

Enterprise Reporting: Enabled users to filter individual locations and roll up results to an enterprise-level view.

Dashboard Design: Organized reporting information into a more concise and accessible format.
