

MSPB Cost of Care & Episode Analytics

Business Problem:

Hospital leadership lacked visibility into total Medicare spending across the full MSPB episode, making it difficult to understand how costs were distributed before admission, during the inpatient stay, and after discharge. Leaders needed a consolidated view of episode-level spending to identify high-cost areas and opportunities to improve care coordination and reduce avoidable post-discharge

Business Solution:

Developed an MSPB analytics and reporting solution that consolidated Medicare spending data across pre-admission, inpatient, and post-discharge periods into a centralized Power BI dashboard. Created standardized cost metrics and drill-down capabilities by hospital, service line, diagnosis, and provider, enabling leadership to identify high-cost episodes, analyze post-discharge utilization patterns, and prioritize opportunities for cost reduction and improved patient outcomes.
